

.JS VS .JSX

File

.JS FILES:

1

Regular JavaScript files used for React development.

2

JSX syntax can still be used, but it needs to be explicitly configured for transpilation into regular JavaScript.

3

You'll typically find React components written using regular JavaScript syntax, with JSX interspersed, but JSX needs to be transformed before it can be understood by the browser.

.JSX FILES:

- 1 Files specifically designated for React development.
- 2 JSX syntax can be used directly without the need for additional configuration.
- 3 SX is understood and transpiled into regular JavaScript automatically, usually by tools like Babel.
- 4 JSX files offer a more streamlined approach to writing React components, as you can write JSX syntax directly without worrying about extra configuration steps.
