🚀 DAY 21: JAVASCRIPT HTTP METHODS (GET, POST, PUT, DELETE) EXPLAINED! 🌐

Lakshmiprasanna Vakada

JavaScript is widely used for interacting with web APIs. To communicate with a server, we use HTTP methods like GET, POST, PUT, and DELETE.

🔹 What are HTTP Methods?

HTTP (HyperText Transfer Protocol) defines different request methods to perform operations on a server. Here are the most commonly used methods in JavaScript

Method	Purpose 📌	Example Use Case
GET	Fetch data from a server	Load user details
POST	Send new data to the server	Register a new user
PUT	Update existing data	Update user profile
DELETE	Remove data from the server	Delete an account

🔹 1. GET Request (Fetching Data)

The GET method retrieves data from an API or server.

✅ Example using fetch()

```
fetch("https://jsonplaceholder.typicode.
com/posts/1")
  .then(response => response.json())
// Convert response to JSON
  .then(data => console.log(data))
// Handle the data
  .catch(error =>
console.error("Error:", error));
```

📌 Output:

```
{
  "userId": 1,
  "id": 1,
  "title": "Sample title",
  "body": "Sample content"
}
```

👉 Use case: Fetching user details, articles, or product lists.

🔷 2. POST Request (Sending Data)

The POST method is used to send new data to the server.

✅ Example using fetch()

```
fetch("https://jsonplaceholder.typicode.com
/posts", {
  method: "POST",
  headers: { "Content-Type":
"application/json" },
  body: JSON.stringify({ title: "New Post",
body: "Hello World!", userId: 1 })
})
  .then(response => response.json())
  .then(data => console.log("Created
Post:", data))
  .catch(error => console.error("Error:",
error));
```

📌 Output:

```json
{
  "title": "New Post",
  "body": "Hello World!",
  "userId": 1,
  "id": 101
}
```

👉 Use case: Registering a user, submitting a form, adding new data.

🔷 3. PUT Request (Updating Data)

The PUT method updates an existing record on the server.

✅ Example:

```
fetch("https://jsonplaceholder.typicode.com
/posts/1", {
  method: "PUT",
  headers: { "Content-Type":
"application/json" },
  body: JSON.stringify({ title: "Updated
Title", body: "Updated Content", userId: 1
})
})
  .then(response => response.json())
  .then(data => console.log("Updated
Post:", data))
  .catch(error => console.error("Error:",
error));
```

📌 Output:

```
{
  "title": "Updated Title",
  "body": "Updated Content",
  "userId": 1,
  "id": 1
}
```

👉 Use case: Editing user details, updating a blog post.

🔷 4. DELETE Request (Removing Data)

The DELETE method removes data from the server.

✅ Example

```
fetch("https://jsonplaceholder.typicode.co
m/posts/1", {
  method: "DELETE"
})
  .then(() => console.log("Post deleted
successfully!"))
  .catch(error => console.error("Error:",
error));
```

📌 Output:

```
Post deleted successfully!
```

👉 Use case: Deleting user accounts, removing comments.

🔷 Fetch vs Axios: Which One to Use?

JavaScript provides two common ways to make HTTP requests:

Feature	fetch()	Axios
Built-in?	✅ Yes	❌ No (External library)
Automatic JSON parsing	❌ No (Need .json())	✅ Yes
Handles Errors	❌ No	✅ Yes
Simpler Syntax	❌ No	✅ Yes

Example with Axios:

```
axios.get("https://jsonplaceholder.
typicode.com/posts/1")
  .then(response =>
console.log(response.data))
  .catch(error =>
console.error("Error:", error));
```
