

Master the DOM with JavaScript:

The secret behind interactive, modern web applications

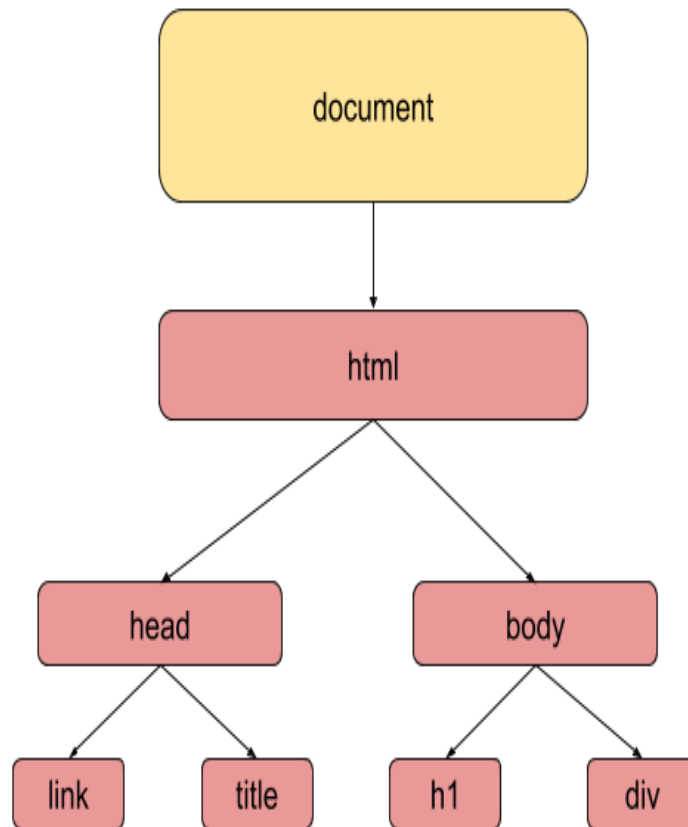

Mastering the DOM

1.What is DOM?

- DOM = **Document Object Model**
- Represents web pages as a **tree structure**
- Lets JavaScript **read, change, and react** to HTML & CSS

DOM TREE:

2.DOM Essentials:

- Select elements

- Change content/styles
- Create/remove nodes
- Handle events

“document.querySelector("#msg").textContent = "Hello DOM!";”

Creating and add an Element:

```
const heading = document.createElement("h1");
const headingText = document.createTextNode("Hello World!");
heading.appendChild(headingText);
document.body.appendChild(heading);
```

Update an Element:

```
//html code
<p id="myParagraph">Hello</p>

//javascript code
const paragraph = document.getElementById("myParagraph");
paragraph.textContent = "World";
```

Delete an Element:

```
//html code
<p id="myParagraph">Hello</p>

//javascript code
const elementToDelete = document.getElementById("paragraph");
elementToDelete.remove();
```

3. Where DOM Helps You:

Examples:

- Real-time **form validation**
- Dynamic **to-do lists**
- Interactive **dashboards**
- Show/hide elements on action

4. Tips for Beginners:

Tips:

- Start with **mini projects** (counter, to-do app)
- Use **browser dev tools**
- Practice **event handling**
- Explore **MDN Docs**

document.querySelector("button")

.addEventListener("click", () => alert("Clicked!"));

LEARN & INNOVATE

5.Quick Example:

Scenario: A button changes heading color.

```
document.querySelector("button")
  .addEventListener("click", () => {
    document.querySelector("h1").style.color = "red";
  });
```

6.Your Turn 💡 :

Content:

- DOM skills = **stronger JS foundation**
- Practice daily for **placements & interviews**
- Build & share projects → **visibility + growth**
