GEO Location

JavaScript offers a built-in Geolocation API that allows web applications to retrieve a user's current geographical position.

By leveraging this feature, developers can access latitude & longitude coordinates, providing valuable insights to user.

Use Cases

Location Based Services like food delivery apps, weather app....

Navigation Services like Maps....

Geotagging Services as tagging user-generated content, such as photos or social media posts, with location information for enhanced context.

Localized Experiences Customizing language, currency, or content based on the user's geographic region to create personalized experiences.

How to access ?

```
1 // Printing location from geolocation
2
3 navigator.geolocation.getCurrentPosition((position) => {
4     const latitude = position.coords.latitude;
5     const longitude = position.coords.longitude;
6     console.log("Latitude:", latitude);
7     console.log("Longitude:", longitude);
8 });
9
```

This will print **latitude** & **longitude** of user's current location. (if permission granted)
