

Falsey and Truthy values in JavaScript

- When any operand in logical operation is not boolean true or false then javascript engine tries to interpret it as truthy or falsey
- Falsey values (false)
 - Nan , undefined , null , 0 , " , false
- Truthy value
 - any value which is not falsey
- Rule 1: falsey value || truthy value --- returns truthy value
- Rule 2 : falsey value-1 || falsey value-2 -- returns last falsey value

JavaScript

Falsey and Truthy values in JavaScript

```
let output = false || null || undefined || NaN;

console.log(output); // output : NaN ( Rule 2 )

//=====
output = false || null;

console.log(output); // output : null ( Rule 2 )

//=====
output = false || undefined;

console.log(output); // output : undefined ( Rule 2 )

//=====
output = undefined || 'ABC';

console.log(output); // output : ABC (Rule 1 )

//=====
output = NaN || 0 || 'XYZ';

console.log(output); // output : XYZ (Rule 1 )
```
