

DAY 37: JAVASCRIPT INTERVIEW QUESTIONS - (Q1–Q10)

Lakshmiprasanna Vakada

? Q1: What are var, let, and const?

- ✓ var is function-scoped, can be redeclared and reassigned.
- ✓ let is block-scoped, cannot be redeclared but can be reassigned.
- ✓ const is block-scoped, cannot be redeclared or reassigned.

? Q2: What is hoisting?

- ✓ Hoisting moves variable and function declarations to the top of their scope.
- ✓ var is hoisted with undefined, but let/const are hoisted in the temporal dead zone.

? Q₃: What is the difference between == and ===?

- ✓ == compares value (performs type coercion).
- ✓ === compares value and type (strict equality).

```
0 == '0' // true
0 === '0' // false
```

? Q₄: What are primitive and non-primitive data types?

- ✓ Primitive: string, number, boolean, null, undefined, symbol, bigint.
- ✓ Non-Primitive: objects, arrays, functions.

? Q5: What is a closure in JavaScript?

- ✓ A closure is a function that remembers its outer scope even after the outer function has finished execution.

```
function outer() {  
  let x = 10;  
  return function inner() {  
    console.log(x);  
  }  
}  
  
const fn = outer();  
fn(); // 10
```

? Q6: What is the difference between null and undefined?

✓ null is an intentional absence of value (assigned by the developer).

✓ undefined means a variable has been declared but not assigned a value.

? Q7: What is the difference between function declaration and expression?

✓ Declaration:

```
function greet() { }
```

✓ Expression:

```
const greet = function() { }
```

Declarations are hoisted; expressions are not.

? Q8: What is a callback function?

- ✓ A function passed as an argument to another function to be executed later.

```
function greet(name, callback) {  
  callback(`Hello ${name}`);  
}  
greet('Arpita', msg => console.log(msg));
```

? Q9: What is the event loop in JavaScript?

- ✓ The event loop handles asynchronous callbacks. It checks the call stack and the task queue and moves tasks to the stack when it's empty.

? Q10: What is the difference between synchronous and asynchronous code?

- ✓ Synchronous: tasks run one after another, blocking execution.
- ✓ Asynchronous: tasks run independently using callbacks, promises, or `async/await`.
